

Agrilek 'Generator & Mechanical Services Division' has been involved in the repair, maintenance and installation of generators, and fixed & mobile plant for many years.

We supply & install generators with synchronisation for both on and off system capability, as well as standalone sets.

Our mechanical services also include on-site preventative maintenance, shutdown and breakdown cover.

We provide diamond drilling and other services supplementary to construction; and as an appointed supplier, our engineers are trained and certified for the application of Belzona Polymeric Limited repair and maintenance products.

example projects

- Generator maintenance, test & repair for United Utilities Electrical Distribution
- M&E servicing, monitoring and breakdown cover for local wind turbine sites
- Plant maintenance and repairs to hydro-electricity generating stations
- Pump repair and on-site preventative maintenance for Environment Agency sites
- Temporary power generator installations for electricity generating companies, industrial sites, exhibitions & events
